SLOTTED LINER ASSEMBLIES

HORIZONTAL LINERS-ONE TRIP MECHANICAL

Chancellor provides customers with a complete product line for horizontal slotted liner assemblies. Whether it is a simple shallow horizontal or a more challenging extended reach or deeper horizontal, Chancellor has the right tool for the application. The simplest horizontal slotted liner assembly consists of a bullnose guide shoe on bottom with a liner packer on top. The adapter is sufficiently strong for pushing or pulling the liner while maintaining a seal setting safety position. Circulating or wellbore fluid change over is an option with the addition of the circulating shoe and inner tubing string. Seal setting is done by reciprocal force and setting tool release is accomplished with RH rotation. No rotation is allowed while running in the hole. This simple and efficient horizontal liner assembly performs quite well for shallow applications.

LINER ON BOTTOM
CIRCULATING IN HOLE OR
PUMPING CHANGE OVER

LINER TOP PACKER SET
SETTING TOOLS RELEASED
CIRCULATING OR
